

Tooth-cleaning and aftercare for implantations

The doctors of your dental practice recommend that you make the following appointments to ensure successful implantation:

1. on the day of implantation:
15 minutes tooth-cleaning and root-of-tongue cleaning
2. the day after the procedure:
wound control
3. One week after the procedure:
wound control, suture removal and biofilm removal
4. Five weeks after the procedure:
oral hygiene control, establishment of calculus and bleeding index,
biofilm removal
5. 2 weeks before exposure of the implants
(in the lower jaw the healing period is 3 months, in the upper jaw 6
months):
professional tooth-cleaning

In the subsequent period, the German Society of Dental and Oral Medicine (Deutsche Gesellschaft für Zahn-, Mund-und Kieferheilkunde) recommends a three-month interval between the dates of professional tooth cleaning.

X-ray checks of the implants are recommended after one, three and five years.
